

Question

How do you provide a link to a user where only one set of calendars would be shown in the calendar plus web part?

Answer

In order to be able to show calendars using a query string URL, you need to group your calendars into meeting categories when setting them up in the calendar plus web part first. When setting up either a shared Exchange calendar or a SharePoint calendar, there will be a field called “Meeting category name”. This allows you to add your calendars to a group.

KWizCom CalendarPlus Settings ✕

GENERAL SETTINGS	CALENDAR VIEW SETTINGS	TOOLBAR & SIZE SETTINGS	MINI CALENDAR SETTINGS
TABLE VIEW SETTINGS	OUTLOOK WEB ACCESS (OWA)	SHAREPOINT CALENDAR LISTS	CUSTOM WEB SERVICE PROVIDER
GOOGLE CALENDAR	ADDING NEW ITEMS SETTINGS	TIME ZONE SETTINGS	LANGUAGE SETTINGS
RESOURCES			

In case you wish to display data from shared calendar please enter the email address (Shared Calendar: shared@domain.com).
if you want to show a named calendar which belongs to the shared calendar please enter the the email address and calendar name devided by slash (Shared Calendar: shared@domain.com/name).
In case you wish to display data from a public calendars please enter the full path (Public calendar for Exchange 2003: http://server/public/public_calendar). Public calendar for Exchange 2007/2010/2013: public_calendar)

Show in legend

Legend alias

Show in meeting categories

Meeting category name

Background Color

Text Color

Current Shared Calendars(Click Apply to accept changes)

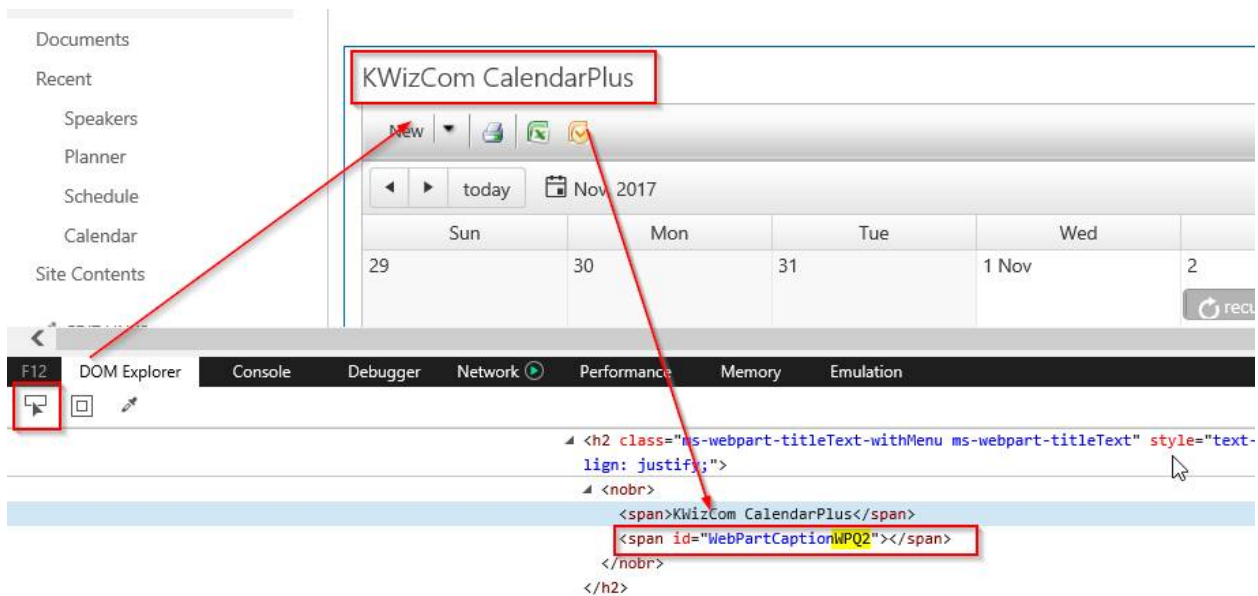

After doing that, you can use the following query string to show only certain meeting categories:

Showing calendar groups using a query string

?ms-cal-selectedlegendsWPQ2=;cat1;

Cat1 would be replaced by the name of the categories you want to show separated by a semicolon.

WPQ2 is the web part qualifier To find this value, you can use your browser dev tools to inspect the title element of the calendar web part. This value would likely be WPQ1, WPQ2, WPQ3 etc.

In this case to show the above pictured calendar, the URL with the query string would be:

<https://kwiz-dean.cloudapp.net:2013/calendar/SitePages/Home.aspx?ms-cal-selectedlegendsWPQ2=;cat1;>
